Problem Background

Adding up numbers is very easy, unless you add a twist. If two numbers are the same, sum their sums!

Problem Description

Your program will be given two numbers. If they are not equal, return their sum. If they are equal, return double their sum.

Sample Input

The first line of your program's input, received from the standard input channel, will contain a positive integer representing the number of test cases. Each test case will include a single line consisting of two non-negative integers separated by spaces.

```
5
1 3
2 2
3 2
13 13
125 9
```

Sample Output

For each test case, your program must output the value calculated according to the rules described above.

```
4
8
5
52
134
```
